Nature of the problem

Given Jacobian:

$$determinant: -abc\rho^2 \sin(\varphi)$$

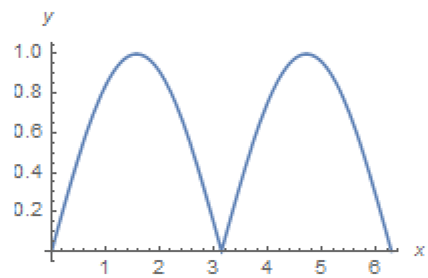
Triple Integral:

- The triple integral will need to be broken up into 2 integrals

$$|abc\rho^2(-\sin(\varphi))| = |abc\rho^2| * |-\sin(\varphi)|$$

$|abc|$ Is just a constant and $|\rho^2|$ will always range from 0 to 1 and won't be negative

$|-\sin(\varphi)|$ On the other hand is different from $-\sin(\varphi)$ and looks like this:



- Therefore it needs to be broken up into two integrals, one from $0\ to\ \pi$ and the other from $\pi\ to\ 2\pi$
- Luckily, due to symmetry, you have:

$$2\int_0^{\pi}\int_0^{\pi}\int_0^{1}[(abc)\rho^2 \sin(\varphi)]\, d\rho d\varphi d\theta$$

$$V = 2abc\int_0^{\pi}\int_0^{\pi} sin(\varphi)\int_0^{1}[\rho^2]\, d\rho d\varphi d\theta$$

$$V = 2abc\int_0^{\pi}\int_0^{\pi} \sin(\varphi)\int_0^{1}[\rho^2]\, d\rho d\varphi d\theta$$

$$V = 2abc\int_0^{\pi}\int_0^{\pi} \sin(\varphi)\, d\varphi d\theta \left[\left(\frac{1}{3}\right)p^3\right]\Bigg|_0^1$$

$$V = \left(\frac{2}{3}\right)abc\int_0^{\pi}\int_0^{\pi} \sin(\varphi)\, d\varphi d\theta$$

$$V = \left(\frac{2}{3}\right)abc\int_0^{\pi} d\theta[-\cos(\varphi)]\Bigg|_0^{\pi}$$

$$V = \left(\frac{2}{3}\right)abc(-(-1)+(1))\int_0^{\pi} d\theta$$

$$V = \left(\frac{2}{3}\right) abc(2)[\theta]$$

$$V = \left(\frac{4}{3}\right) abc[\pi - 0]\Bigg|_{0}^{\pi}$$

$$V = \frac{4\pi}{3} abc$$

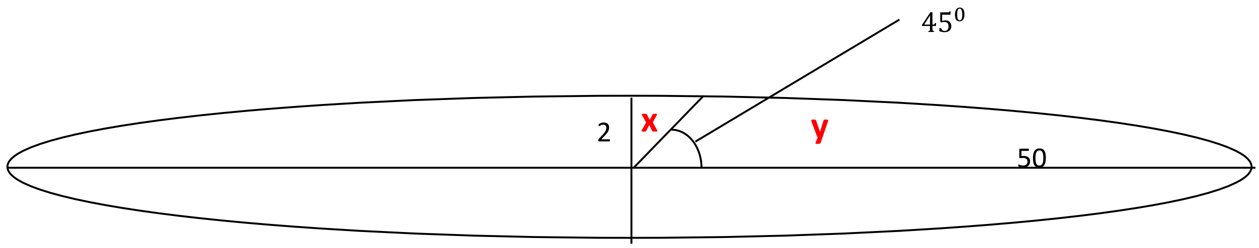
Unfortunately, this still does not solve the problem for values other than increments of $\frac{\pi}{2}$. For example if we integrated the ellipsoid using this jacobian from $o\ to\ \frac{\pi}{2}$ for φ and $0\ to\ \frac{\pi}{4}$ for θ, I do not get an accurate volume for that portion of an ellipsoid. This means the way I am approaching this problem is fundamentally wrong.

$$V_y = \int_0^{\frac{\pi}{4}} \int_0^{\frac{\pi}{2}} \int_0^1 [(abc)\rho^2 \sin(\varphi)]\, d\rho d\varphi d\theta = \frac{\pi}{6} abc$$

This is only true if $a = b = c$

$$V_x = \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^1 [(abc)\rho^2 \sin(\varphi)]\, d\rho d\varphi d\theta = \frac{\pi}{6} abc$$

$$\boxed{But\ what\ if\ a = 50, b = 2\ and\ c = 2?}$$



$$\boxed{x \neq y}$$

But according to the above integration, it does. This is what I need to fix.
